sciences humaines du Canada

**Canada**

*This research is supported by the Social Sciences and Humanities Research Council of Canada.*

**Grant title:** Computer modeling to address homelessness: An exploratory study

**Period:** March 15 2016 – March 31 2019

PI: Eric Latimer Co-PI: Vijay Mago

Co-Investigators: Tim Aubry, Stephen Gaetz, Laurence Roy

Collaborator: Philippe Giabbanelli

Knowledge users: Mike Bulthuis, James McGregor

Analysts: Erik Tillberg, Zhirong Cao

*We also wish to acknowledge periodic informal exchanges with Mark Fox, Michael Gruninger and Bart Gajderowicz of the Center for Social Services Engineering at the University of Toronto*

1. Introduction
2. Modelling approaches
  - Fuzzy cognitive Maps
  - Cellular Automata
  - Rule-Based Models
3. Current modeling approach with preliminary transition probability estimates
4. Projected future work
5. Concerns and limitations

# Introduction

Simulation modeling: an approach for estimating the effects of policy scenarios

- Mansur et al. (2002)
- Culhane et al. (ongoing) – Homelessness analytics initiative
- Mago et al. 2013

Examining policies to reduce homelessness  
using a general equilibrium model  
of the housing market

Erin T. Mansur,<sup>a,c</sup> John M. Quigley,<sup>a,b</sup> Steven Raphael,<sup>b,\*</sup> and  
Eugene Smolensky<sup>b</sup>

Calibrated to 4 California cities, this model-based analysis concludes that “a very large fraction of homelessness can be eliminated through increased reliance upon well-known housing subsidy policies”.

The screenshot shows a web browser window with the URL [www.homelessnessanalytics.org](http://www.homelessnessanalytics.org). The page features a blue header with the site logo and navigation links for 'Forecast', 'Login', 'Register', and a 'Get Started' button. The main content area has a blue background with the text: 'Access critical **national, state,** and **local** information about homelessness and related factors.'

Below this text are three circular icons representing different data visualization capabilities:

- Explore Maps and Variables:** Shows a map of Chicago with a data table overlay. The table lists:
 

Total Homeless Persons (2012)	6,210
Total Unsheltered Persons (2012)	6,202
Family Homelessness Total (2012)	770
Individuals Total (2012)	4,376
Veterans Total (2012)	526
- Forecast Changes in Homelessness:** Shows a bar chart comparing 'Forecast' and 'Historical' data across different categories.
- Charts, Graphs, and Tables:** Shows a scatter plot titled 'Total Homeless Persons... vs. Total Unsheltered' with a regression line.

The Windows taskbar at the bottom shows the time as 8:25 PM on 2017-05-13.

## Project objectives

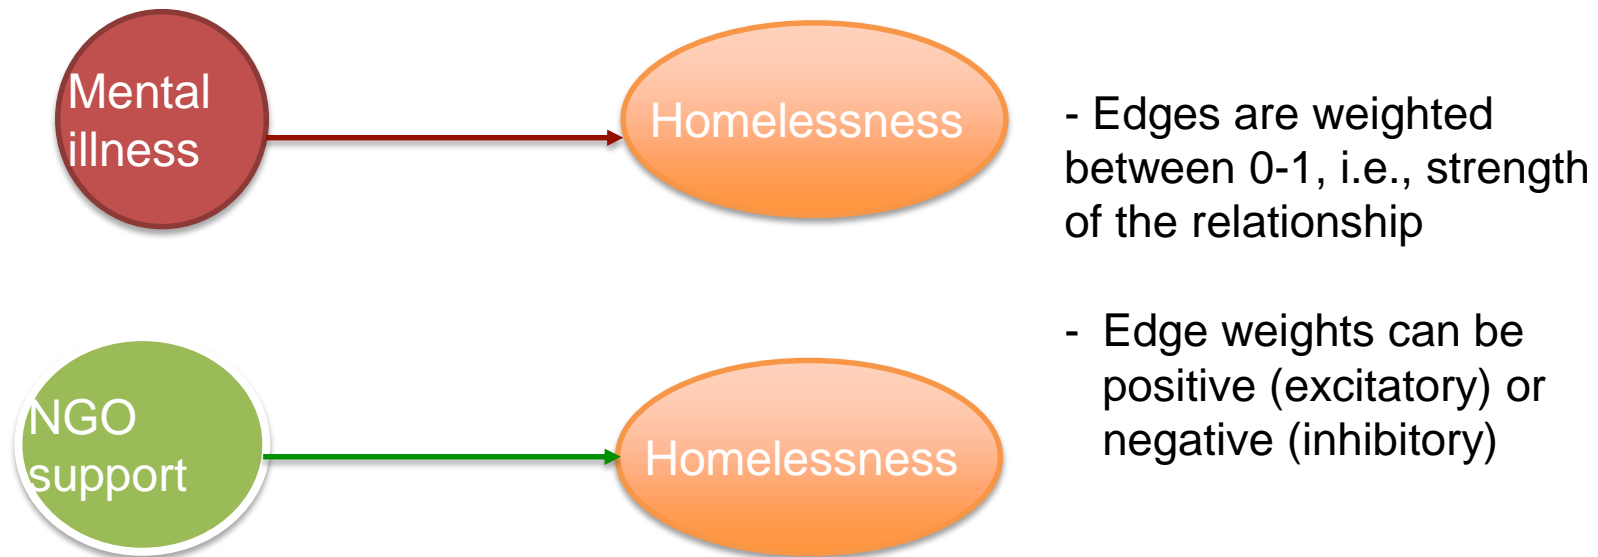

- To construct a computer simulation model designed to shed light on how contextual factors and policies interact to influence the number of homeless people and their composition over time.
- Estimate the costs of the policies themselves, and their net costs to service systems **in Montreal and Ottawa.**

## Strategy

- Construct and calibrate model based on:
  - Literature review
  - Expert panels where lit review insufficient
  - Available data sets

## Modelling Approaches - Fuzzy Cognitive Maps

## Modelling Approaches - Fuzzy Cognitive Maps

- Levels

  - + Individual (mental maps)

  - + Contextualized (policies)

- Edge Weights

  - + Learned from the data

  - + Aggregate opinion (expressed in linguistic terms) of the experts

## Modelling Approaches - Fuzzy Cognitive Maps

Mago, V. K., Morden, H. K., Fritz, C., Wu, T., Namazi, S., Geranmayeh, P., ... & Dabbaghian, V. (2013). Analyzing the impact of social factors on homelessness: a Fuzzy Cognitive Map approach. *BMC medical informatics and decision making*, 13(1), 94.

## Modelling Approaches - Cellular Automata

The Grid – Homeless population

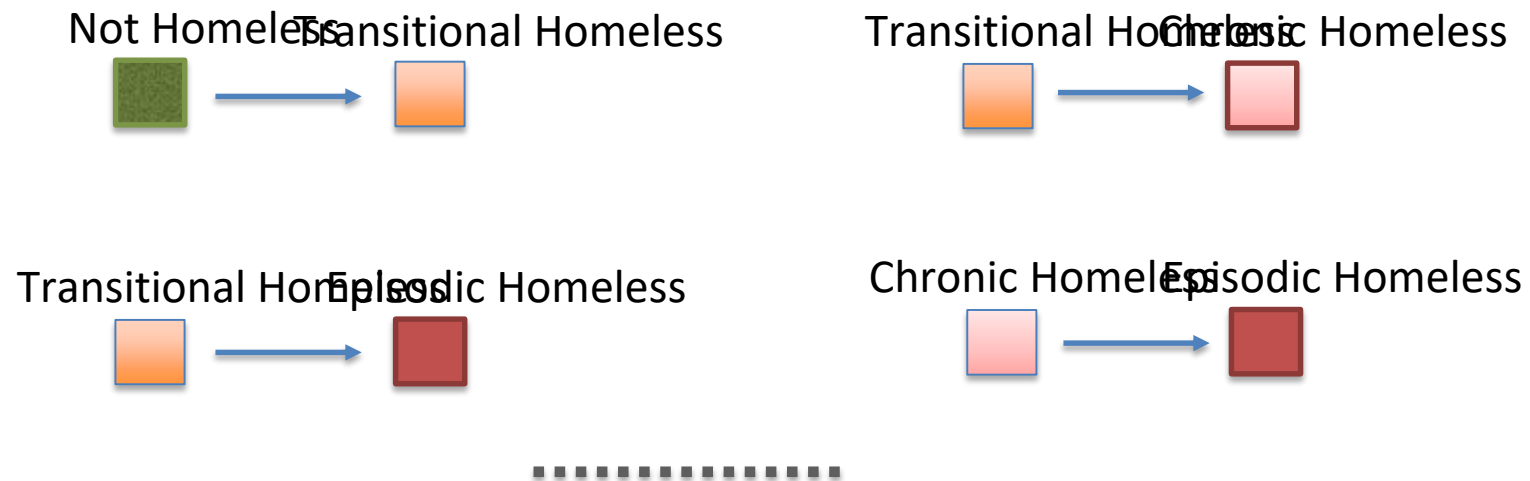

A Cell – Homeless individual

The Neighbourhood – Surrounding homeless individuals

States – Unstable, Street, Sheltered, Not Homeless, others.

# Modelling Approaches - Cellular Automata

- Rules of updating the states - *Influenced by the neighbourhood*

## Modelling Approaches - Rule Based Model

Set of assertions (rules) - “if-then”

Transition from one state to another can be  
deterministic or probabilistic

Fairly simplistic and easy to encode knowledge  
of experts

Demo: <http://mcgill.thicketlabs.com>

## Current modeling approach (1)

- Assimilate couch surfing and SROs with not homeless as we have no way of counting people in those types of homelessness.
- When people first become homeless, they can enter one of the following states:
  - Street
  - Emergency shelter
  - Transitional housing
  - Other (hospital, detox, substance use Tx, prison)

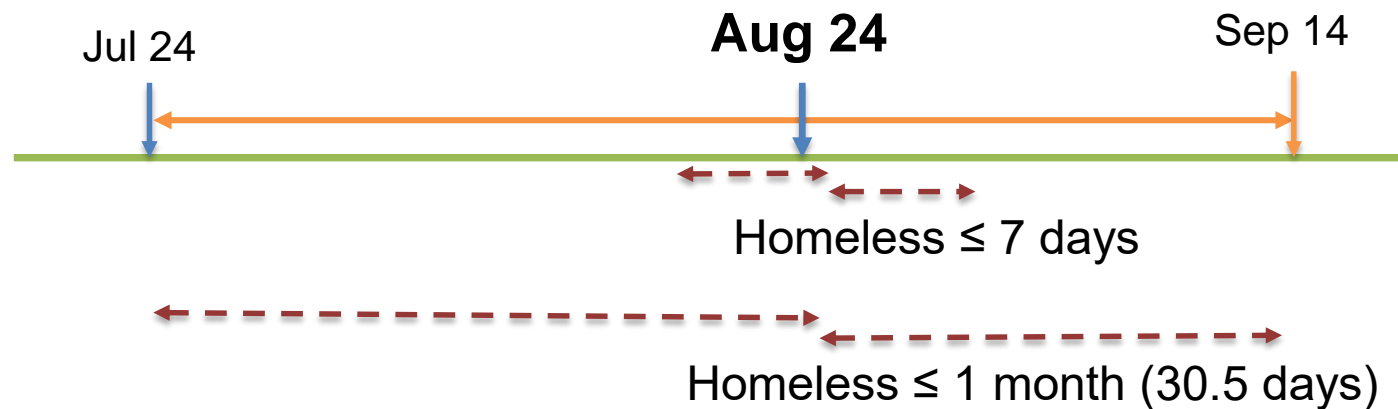

## Current modeling approach (2)

- Assimilate couch surfing and SROs with not homeless as we have no way of counting people in those types of homelessness.
- When people first become homeless, they can enter one of the following states:
  - Street
  - Emergency shelter
  - Transitional housing
  - Other (hospital, detox, substance use Tx, prison) (after a possibly very brief period of days)
- What do the data tell us about these transitions?

## Montreal complementary summer homelessness survey Aug – Sep 2015

- *Where were you on the night of August 24?*
- *How long since you had a permanent place to stay?*  
(Interviews Aug 25 – Sep 14)

**Survey results: Where people said they were on the night of Aug 24, according to whether at time of interview they had been homeless 7 days or less, or one month or less (Total N: 1083)**

To From	Street	Emergency shelter	Transitional housing	Other*	Hidden homeless
Homeless ≤ 7 days	0	8	0	1	0
Homeless ≤ 30 days	13	39	4	2	7

***When people begin a homelessness episode, they appear in general to first go to a homeless shelter, then possibly transition to other types of settings***

\*Other: hospital, detox, substance use Tx, prison

**Transition probabilities from the Treatment-as-usual group of At Home/Chez Soi in Montreal – up to 24-month follow-up, data grouped in months (based on 3,785 non-missing transitions)**

To From	Mix	Street	Shel- ter	Tran- sition- al	Other	Hidden Hmlss	Not Hmlss	Death	ROW SUM
Mix <sup>a</sup>	7.40	1.32	2.14	0.5	1.85	1.85	1.16	0.03	16.25
Street	1.22	7.37	0.18	0.03	0.32	0.18	0.03	0	9.32
Shelter	2.30	0.18	8.48	0.24	0.21	0.98	0.16	0	12.55
Trans.	0.21	0	0.03	11.39	0.05	0.05	0.03	0	11.76
Other	1.35	0.18	0.18	0.16	11.55	0.55	0.13	0	14.11
Hidden	2.17	0.16	0.63	0.16	0.42	16.91	0.66	0	21.11
Not HL	0.66	0.03	0.05	0.03	0.05	0.40	13.03	0.03	14.27
Death								0.63	0.63
SUM	15.31	9.24	11.69	12.51	14.45	20.92	15.20	0.69	100

<sup>a</sup> Mix = mixed. Less than 75% of the time in one type of place over one month. To be reduced by re-analyzing using one-week cycles; <sup>b</sup> includes some permanent supportive housing.

*In Montreal, people tend to stay in transitional housing, rarely exiting homelessness; somewhat true of people in street as well*

To From	Mix	Street	Shel- ter	Tran- siti- onal	Other	Hidden Hmlss	Not Hmlss	Death	ROW SUM
Mix*	7.40	1.32	2.14	0.5	1.85	1.85	1.16	0.03	16.25
Street	1.22	7.37	0.18	0.03	0.32	0.18	0.03	0	9.32
Shelter	2.30	0.18	8.48	0.24	0.21	0.98	0.16	0	12.55
Trans.	0.21	0	0.03	11.39	0.05	0.05	0.03	0	11.76
Other	1.35	0.18	0.18	0.16	11.55	0.55	0.13	0	14.11
Hidden	2.17	0.16	0.63	0.16	0.42	16.91	0.66	0	21.11
Not HL	0.66	0.03	0.05	0.03	0.05	0.40	13.03	0.03	14.27
Death								0.63	0.63
SUM	15.31	9.24	11.69	12.51	14.45	20.92	15.20	0.69	100

\*Mix = mixed. Less than 75% of the time in one type of place over one month. To be reduced by re-analyzing using one-week cycles.

# Modeling probability of becoming homeless

- Everyone has a certain vulnerability to become homeless – denoted by  $v$  – if  $v = 0$  person has 0 probability of becoming homeless from one cycle to the next; if  $v=1$ , 100% chance of becoming homeless
- “Context-level” fuzzy cognitive map to be used to determine distribution of  $v$  in the population (combination of personal or predisposing factors, and environmental factors)
- Important to do modeling separately for men and women, Indigenous and non-Indigenous, probably older vs younger

# Modeling transition probabilities : effects of programs

- Programs have two possible effects:
  - Reduce individual's "vulnerability"
  - Directly house individual (eg HF) or not (day centre)
- Programs also characterized by duration
- These 3 parameters to be based on combination of literature and expert opinion
- Cost also to be included – can vary according to how program implemented, which also influences effects

## Projected future work

- Develop context-level FCM
- Model transition probabilities (rule-based rather than cellular automata?)
- Extend to Ottawa data

## Concerns / limitations

- Challenging to move quickly – much developmental work required of core investigators
- Too many parameters make model intractable, but too few mean oversimplification
- Exploratory study: May not be possible to develop a credible model; at least will help synthesize knowledge and derive implications for effects and costs of different program combinations in different contexts

# Thank you for your attention
